

## REMARKS

After filing the subject application, it was noted that the formulas did not reflect the compounds in that oxygens were incorrectly placed. Since the compounds are based on the reaction of a dicarboxylic acid and a bis-hydroxylalkyl polysulfide, it is evident that the formulas did not correspond to the expected products by having an extra oxygen in the definitions of F and F<sup>1</sup>, while lacking an oxygen in the basic formulae.

There is no new matter, rather a minor error in devising the formulae has been corrected to make the formulae consistent with the working exemplification.

The Examiner is respectfully requested to enter the above amendments to provide for a more accurate and consistent specification.

Respectfully yours,
